Research interests

Trustworthy machine learning; weak supervision; benchmark validity; IoT telemetry; temporal evaluation; distribution shift; reliable data systems.

Education

Vinh Long University of Technology Education

2022–2026

Bachelor candidate in Information Technology, Cybersecurity track.

Expected graduation: November 2026 · GPA: 3.21/4.00

Member of the first student cohort following the Cybersecurity track.

Research experience

First-author research on temporal IoT target validity

2026–present

Developing observation contracts and effective evidence formulations for temporal rule-derived agricultural IoT targets, with controls for label construction, temporal history, matched anchors, and deployment transport.

Undergraduate researcher, agricultural IoT analytics

2026

Contributed to data cleaning, dataset organization, weak-label construction, model benchmarking, temporal evaluation, and result analysis for a co-authored conference manuscript submitted to EAI AICON 2026.

Undergraduate thesis researcher

2025–2026

Designed and deployed an ESP32-S3 telemetry system and built a traceable processing pipeline from raw field data to weakly labeled machine-learning benchmarks. Thesis score: 8.9/10.

Publications and manuscripts

Benchmarking Foundation Models and Gradient Boosting for Agricultural IoT Context Analytics: A Weakly Supervised Temporal Evaluation

2026

Hoai-Hanh Tran, Thanh-Nghi Doan, **Lam-Nguyen Nguyen**.

Manuscript submitted to EAI AICON 2026.

Observation Contracts and Effective Evidence in Temporal Rule-Derived Agricultural IoT Targets

2026

Lam-Nguyen Nguyen, Hoai-Hanh Tran, Thanh-Nghi Doan.

Working manuscript (under internal review prior to submission).

Honors and awards

Consolation Prize, Algebra Division B

2025

National Student Mathematics Olympiad.

University representative, National Student Mathematics Olympiad

4 editions

Participated in the Algebra Division B across four editions.

Selected technical skills

Programming and data: Python, tabular machine learning, data cleaning, experiment pipelines, temporal evaluation.

Models and methods: XGBoost, logistic regression, FT-Transformer, TabPFN, weak supervision, class-imbalanced evaluation.

IoT and systems: ESP32-S3, SHT30, RS485/Modbus sensors, SIM A7682S, Firebase Realtime Database, telemetry metadata.

Research tools: Git/GitHub, LaTeX, reproducible artifact organization, technical writing.

Selected academic writing

Undergraduate thesis: *Building an IoT-based System for Monitoring Environmental and Nutritional Conditions in Durian Orchards*, 2026.

Mathematical note: *From Determinants to Rank: An Approach to Parameterized Matrix Problems in Undergraduate Algebra Olympiads*.

Languages

Vietnamese: Native.

English: Institutional B1 equivalent certificate (Vinh Long University of Technology Education).
